**BELIMO®**

Communicative rotary actuator for ball valves

• Torque motor 5 Nm
• Nominal voltage AC/DC 24 V
• Control communicative
• Communication via KNX (S-Mode)
• Conversion of sensor signals
• Integrated KNX 6-way valve application
• KNX condensation monitoring

Technical data

Electrical data		
	Nominal voltage	AC/DC 24 V
	Nominal voltage frequency	50/60 Hz
	Nominal voltage range	AC 19.2...28.8 V / DC 21.6...28.8 V
	Power consumption in operation	2.5 W
	Power consumption in rest position	1.3 W
	Power consumption for wire sizing	5 VA
	Connection supply / control	Cable 1 m, 6 x 0.75 mm²
Data bus communication	Communicative control	KNX (S-Mode)
	Number of nodes	max. 64 per line segment, reduce number of nodes with connecting cable with short lines
	Communication medium	KNX TP
	Operating mode	S-Mode
	Current consumption of KNX-Bus	max. 5 mA
Functional data	Torque motor	5 Nm
	Position accuracy	±5%
	Manual override	with push-button, can be locked
	Running time motor	90 s / 90°
	Running time motor variable	35...150 s
	Adaptation setting range	manual (automatic on first power-up)
	Adaptation setting range variable	No action Adaptation when switched on Adaptation after pushing the manual override button
	Override control, controllable via bus communication	MAX (maximum position) = 100% MIN (minimum position) = 0% ZS (intermediate position) = 50%
	Override control variable	MAX = (MIN + 33%)...100% MIN = 0%...(MAX – 33%) ZS = MIN...MAX
	Sound power level, motor	35 dB(A)
	Parametrisation	with service tool ZTH EU Fast addressing 1...16 via push button possible
	Position indication	Mechanical, pluggable
Safety data	Protection class IEC/EN	III, Safety Extra-Low Voltage (SELV)
	Degree of protection IEC/EN	IP54
	EMC	CE according to 2014/30/EU
	Certification IEC/EN	IEC/EN 60730-1 and IEC/EN 60730-2-14
	Type of action	Type 1
	Rated impulse voltage supply / control	0.8 kV
	Pollution degree	3

Safety data	Ambient humidity	Max. 95% RH, non-condensing
	Ambient temperature	0...50°C [32...122°F]
	Storage temperature	-40...80°C [-40...176°F]
	Servicing	maintenance-free
Weight	Weight	0.52 kg

Safety notes

⚠

- This device has been designed for use in stationary heating, ventilation and air-conditioning systems and must not be used outside the specified field of application, especially in aircraft or in any other airborne means of transport.
- Outdoor application: only possible in case that no (sea) water, snow, ice, insolation or aggressive gases interfere directly with the device and that it is ensured that the ambient conditions remain within the thresholds according to the data sheet at any time.
- Only authorised specialists may carry out installation. All applicable legal or institutional installation regulations must be complied during installation.
- The switch for changing the direction of rotation may only be operated by authorised specialists. The direction of rotation must not in particular be reversed in a frost protection circuit.
- The device may only be opened at the manufacturer's site. It does not contain any parts that can be replaced or repaired by the user.
- Cables must not be removed from the device.
- The device contains electrical and electronic components and must not be disposed of as household refuse. All locally valid regulations and requirements must be observed.

Product features

| Mode of operation	The actuator is equipped with an integrated interface for KNX (S-Mode) and can be connected with all KNX devices that have corresponding data points available.
	The KNX application allows the use of the valve actuator with 2- and 3-way valves with one setpoint as well as with 6-way valves in 4-pipe systems with 2 setpoints for heating and cooling.
Converter for sensors	Connection option for a sensor (passive or active sensor or switching contact). In this way, the analogue sensor signal can be easily digitised and passed along to KNX.
Parametrisable actuators	The factory settings cover the most common applications. As desired, individual parameters can be adapted for specific systems or servicing with a service tool (e.g. ZTH EU) or the ETS planning and commissioning tool.

Application

The 6-way application parametrisable in the KNX actuator allows 4-pipe systems to be controlled using 2 separate setpoints for the heating and cooling sequences.

Heating sequence setpoint 0...100% corresponds to 67...100% valve position.

Cooling sequence setpoint 0...100% corresponds to 33...0% valve position.

If no sequence is active or the condensation monitor has been triggered, the actuator moves to the closed position (middle position 50%).

When operating with the 6-way application, the factory settings for the Min and Max settings (Min=0%, Max=100%) are recommended. The parametrisation of the Min and Max values must be selected carefully when the 6-way application is active, as they affect the control ranges of the heating and cooling sequence.
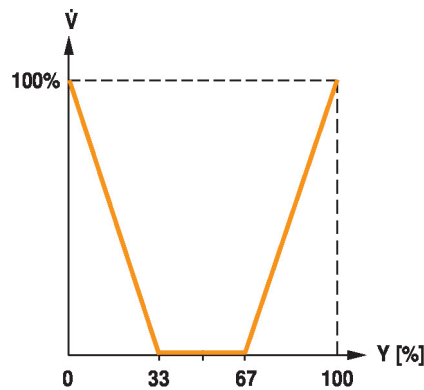

Simple direct mounting

Straightforward direct mounting on the ball valve with only one central screw. The assembly tool is integrated in the plug-in position indication. The mounting orientation in relation to the ball valve can be selected in 90° steps.

Manual override

Manual override with push-button possible (the gear train is disengaged for as long as the button is pressed or remains locked).

Adjustable angle of rotation

Adjustable angle of rotation with mechanical end stops.

High functional reliability

The actuator is overload protected, requires no limit switches and automatically stops when the end stop is reached.

Home position

The first time the supply voltage is switched on, i.e. at the time of commissioning, the actuator carries out an adaptation, which is when the operating range and position feedback adjust themselves to the mechanical setting range.

The actuator then moves into the position defined by the control signal.

Factory setting: Y2 (counter-clockwise rotation).

Adaptation and synchronisation

An adaptation can be triggered manually by pressing the "Adaptation" button or with the PC-Tool. Both mechanical end stops are detected during the adaptation (entire setting range).

Automatic synchronisation after pressing the manual override button is configured. The synchronisation is in the home position (0%).

The actuator then moves into the position defined by the control signal.

A range of settings can be adapted using the PC-Tool (see MFT-P documentation)

Condensation monitoring

By using a condensation monitor at the sensor input of the actuator and the condensation monitoring activated in the KNX application, the formation of condensation water during the cooling sequence can be prevented.

Behaviour with 2-way and 3-way application (factory setting):

When the condensation monitoring is active, the actuator closes (0%).

Behaviour with active 6-way application (4-pipe system):

When the condensation monitoring is active, the actuator moves to the middle position (50%).

Accessories

Tools	Description	Type
	Service Tool, with ZIP-USB function, for parametrisable and communicative Belimo actuators, VAV controller and HVAC performance devices	ZTH EU
	Belimo PC-Tool, Software for adjustments and diagnostics	MFT-P
	Adapter for Service-Tool ZTH	MFT-C
	Connecting cable 5 m, A: RJ11 6/4 ZTH EU, B: 6-pin for connection to service socket	ZK1-GEN
	Connecting cable 5 m, A: RJ11 6/4 ZTH EU, B: free wire end for connection to MP/PP terminal	ZK2-GEN

Electrical installation

⚠ **Supply from isolating transformer.**

Parallel connection of other actuators possible. Observe the performance data.

Direction of rotation switch is covered. Factory setting: Direction of rotation Y2.
Wire colours:
1 = black
2 = red
3 = white
5 = orange
6 = pink
7 = grey

Functions:
D+ = KNX+ (pink > red)
D- = KNX- (grey > black)
The connection to the KNX line should take place via WAGO connecting terminals 222/221.

### Wiring diagrams

Connection without sensor

Connection with passive sensor, e.g. Pt1000, Ni1000, NTC

|			
Ni1000	−28...+98°C	850...1600 Ω [2]	
PT1000	−35...+155°C	850...1600 Ω [2]	
NTC	−10...+160°C [1]	200 Ω...60 kΩ [2]	

1) depending on type
2) Resolution 1 Ohm
Compensation of the measured value is recommended

Connection with switching contact, e.g. Δp monitor switch

Switching contact requirements: The switching contact must be able to switch a current of 16 mA at 24 V accurately.

Connection with active sensor, e.g. 0...10 V @ 0...50°C
Possible voltage range: 0...32 V
Resolution 30 mV

KNX group objects

Name	Type	Flags					Data point type				Values range

KNX group objects (continuation)

Setpoint	Specification of actuator position in % between the parameterised Min and Max limits. Recommended for 2-way and 3-way ball valves.
Setpoint Heating	Specification of the valve position for the heating sequence of a 6-way ball valve. The heating setpoint can be specified in the range from 0...100%. The flow can be limited with the Max communication object. The setpoint object (heating/cooling) with the last command is preferred.
Setpoint Cooling	Specification of the valve position for the cooling sequence of a 6-way ball valve. The cooling setpoint can be specified in the range from 0...100%. The flow can be limited with the Min communication object. The setpoint object (heating/cooling) with the last command is preferred.
Override control	Overriding the setpoint with defined override states. As data point type, 1 Byte (unsigned) is recommended (DPT 20.*)
Reset	Resetting the stored service messages (see KNX group object *Service information*).
Adaptation	Perform the adaptation. An active adaptation is signaled in Bit 8 of *Service information*.
Testrun	Performance of a testrun that checks the entire operating range. An active adaptation is signaled in Bit 8 of *Service information*. After completion, detected faults (mechanical overload, mechanical travel increased) are signaled in *Service information*.
Min	Minimum Limit (position) in %. Caution: Changing the setting may result in malfunctions.
Max	Maximum Limit (position) in %. Caution: Changing the setting may result in malfunctions.
Relative position	Current actuator position in %
Absolute position	Absolute position/stroke The data point type is to be selected depending on the type of movement:

[°]   DPT 8.011
[mm]   DPT 7.011

Fault state	Collective fault based on Bit 0...Bit 7 of *Service information*.
Overridden	Signaling of an active override control (OPEN/CLOSED) The device can be commanded via the KNX group object *Override control* or via the forced switching at the input Y/3. Only the override controls OPEN and CLOSED are signaled.
Gear disengagement active	Signaling an active gear disengagement
Service information	Detailed information regarding device status As data point type, Bitset 16-Bit is recommended (DPT 22.*) Status information:

Bit 0:   Motor operation in relation to operating period too high
Bit 1:   Mechanical travel increased, e.g. defined end position exceeded
Bit 2:   Mechanical overload, i.e. defined end position not reached
Bit 3...7: not used with this device type
Bit 8:   Internal activity (Synchronisation, Adaptation, Testrun, ...)
Bit 9:   Bus watchdog triggered
Bit 0:   Bit 7 are stored by the device and can be reset with the KNX group object *Reset*. As an alternative, the several bits can be read as collective fault state.

Sensor value	The representation of the sensor value is dependent on the parameterization. See section „KNX parameters – Sensor"

Common

Setpoint at bus failure
A setpoint can be defined for cases of communication interruption.

Values range:	None (last setpoint)
	Open
	Closed
	Mid
Factory setting:	None (last setpoint)

The monitoring of the communication takes place for the KNX group objects *Setpoint* and *Override control*. If none of the objects is written within the parameterised monitoring time, the bus fail position is set and signaled in the *Service information* (Bit 9).

Bus timeout [min]
Monitoring time for the detection of a communication interruption.

Values range:	1...120 min
Factory setting:	–

Setpoint Mode
Two operating modes can be selected.

„Common object mode"	Recommended for operation with 2-way and 3-way ball valves and damper actuators. Corresponds to the control of the actuator with a setpoint of 0...100%.
„Heating and Cooling separated"	Explicitly for the control of the valve actuator with 6-way ball valve. Two setpoints are available as communication objects. One setpoint for heating and one setpoint for cooling. These two setpoints are used by the valve actuator in accordance with the 6-way valve characteristic curve for controlling heating and cooling sequences.

Increment for value update [%]
Actual values (position, volumetric flow) are transferred at the time of a value change insofar as these change by the parameterised difference value. If the relative value changes by the difference value, not only the relative actual value but also the absolute actual value are transferred.

Values range:	0...100%
Factory setting:	5%

The transfer is deactivated with 0% in the event of a value change.

Repetition time [s]
Repetition time for all position and sensor actual values. Status objects are not transferred except with a change.

Values range:	0...3'600 s
Factory setting:	0 = no periodic transmission

Sensor

Sensor type	The input Y/3 can be used to connect a sensor. The sensor value is digitised and made available as KNX communication object.

Values range: No sensor
Active sensor (0...32 V)
Passive sensor 1K
Passive sensor 20K
Switch (0 / 1)
Temperature sensor PT1000 / Ni1000 / NTG10K
Humidity sensor (0...10 V corresponds 0...100%)
Air quality sensor CO2 (0...10 V corresponds 0...2'000 ppm)
Condensation monitor (0 / 1)
Factory setting: No sensor

A switching to Y/3 is treated as local override in the absence of sensor parameterization.

Increment for sensor value update The sensor value is transferred at the time of a value change insofar as this changes by the parameterised difference value.

Values range: 0...65'535 (0.5...10 at temperature)
Factory setting: 1

The transfer is deactivated with 0 in the event of a value change. Without value change, the sensor value is sent because of the repetition time.

Output
(for sensor type „Active sensor") Only for „Active sensor" sensor type

Values range: Sensor value mV (DPT 9.020)
Sensor value scaled (DPT 7.xxx)
Sensor value scaled % (DPT 5.001)
Factory setting: –

For „Sensor value mV", the measured voltage is made available without processing. In the case of the scaled sensor values, a linear transformation can be defined with two points.

Polarity
(for sensor type „Switch") The polarity can be defined for the sensor types „Switch" and „Dewpoint control".

Values range: Normal
Inverted
Factory setting: –

KNX workflows

Product database The product database for the import in ETS4 or higher is available at the Belimo website.

Setting physical address The programming of the physical address takes place by ETS and the programming button on the device.

If the programming button is not accessible or accessible only with difficulty, then the address can be set using a point-to-point connection: "Overwrite Individual Address: 15.15.255"

As a third possibility, the physical address can be programmed on the basis of the KNX series number (e.g. with Moov'n'Group). The KNX series number is placed on the device in two versions. One sticker can be removed for adhesion on the commissioning journal, for example.

Firmware upgrade The KNX firmware of the device is updated automatically with the programming of the application program if the product database has a more recent version.

The first programming procedure takes somewhat longer in such cases (>1 min).

Resetting to KNX factory settings If necessary, the device can be reset manually to the KNX factory settings (physical address, group address, KNX parameters).

For the reset, the programming button on the device must be pressed down for at least 5 s during start-up.

Operating controls and indicators
❶ Push-button and LED display green

Off:	No power supply or malfunction
On:	In operation
Press button:	Triggers angle of rotation adaptation, followed by standard mode

❷ Push-button and LED display yellow

Off:	The actuator is ready
On:	Adaptation or synchronisation process active or actuator in programming mode (KNX)
Flashing:	Connection test (KNX) active
Press button:	In operation (>3 s): Switch the programming mode on and off (KNX)
	When starting (>5 s): Reset to factory setting (KNX)

❸ Manual override button

Press button:	Gear train disengages, motor stops, manual override possible
Release button:	Gear train engages, standard mode

❹ Service plug
For connecting parametrisation and service tools

Service

Notes

⚠️

The actuator can be configured by PC-Tool and ZTH EU via the service socket.

Quick addressing

1. Press the "Address" button until the green "Power" LED is no longer illuminated. LED flashes in accordance with the previously set address.

2. Set the address by pressing the "Address" button the corresponding number of times (1...16).

3. The green LED flashes in accordance with the address that has been entered (...16). If the address is not correct, then this can be reset in accordance with Step 2.

4. Confirm the address setting by pressing the green "Adaptation" button.

If no confirmation occurs for 60 seconds, then the address procedure is ended. Any address change that has already been started will be discarded.
The resulting BACnet MS/TP and Modbus RTU address is made up of the set basic address plus the short address (e.g. 100+7=107).

Tools connection

The actuator can be parametrised by ZTH EU via the service socket.

For an extended parametrisation the PC tool can be connected.
